

WHEN TO ADD FLAVACOL

Flavacol will adhere to the popcorn and achieve the best coverage if it is added early in the popping process directly into the melted/liquid oil. This could be at the same time as you add the popcorn kernels.

Flavacol is a very fine seasoned yellow salt that sticks to the popcorn, whereas a standaground salt will tend to fall off. Adding it to the oil as you pop improves the coverage without any fear of burning.

The popcorn machine's agitator arms (or manual shaking of your popping pot) will then distribute the salt evenly and coat all the kernels before they pop.
